Dairy-Herd-Improvement-Association Letter

ARS-52-21
(Vol. 31, No. 10)

October 1955

A HALF CENTURY OF DHIA WORK

Fifty years ago, on September 26, 1905, a recently arrived Danish immigrant with a vision and knowledge of what organized production testing had meant to the dairy farmers of his native land, was instrumental in calling together a group of dairy farmers in Newaygo County, Mich., to organize the first dairy-herd-improvement association in this country.

Helmer Rabild, the man who called the meeting, was born and raised in Denmark. He came to the United States, settled in Michigan, and was employed by the State Dairy and Food Department of the Michigan Department of Agriculture. Mr. Rabild believed that a testing program similar to the one in his native land would be of inestimable value to the dairy farmers of the United States.

The historic meeting that launched the DHIA Program in this country was attended by 6 or 8 dairymen who, after hearing Mr. Rabild explain the advantages of an organized production testing program, appointed a committee to organize an association. The association (then called Cow-Testing Association) began operating in January 1906. Thirty-one herds, consisting of 239 cows (7.7 cows per herd) were tested the first year. A summary of the records at the end of the year showed that the 239 cows averaged 5,300 pounds of milk and 215 pounds of butterfat.

In 1909, the dairy-herd-improvement association work became a Federal project. Mr. Rabild joined the U. S. Department of Agriculture and became the first to head the project. Under his leadership and guidance the idea of organized production testing was carried to all the States.

The growth of production testing over the years is one of the outstanding accomplishments in our agricultural development. On January 1, 1955, 2,208 associations were operating (one or more in each State, Hawaii, and Alaska). These associations were testing 41,240 herds consisting of more than 1,333,000 cows. The average production per cow for DHIA cows on test during 1954 was 9,663 pounds of milk and 372 pounds of butterfat.

The growth and development of the present-day program is a signal honor to the vision and sound judgment of the original founders of the program and to the diligent and constant guidance of the dairy leaders of the States and Territories. With this continuous able leadership, the next half century of organized production testing should bring even greater rewards to the dairymen and to the dairy industry of the Nation.

DHIA PROVED-SIRE RECORDS TABULATED IN SEPTEMBER 1955

Following is a list of 530 sires whose records were tabulated or retabulated by the Dairy Husbandry Research Branch in September 1955. Production records used in proving DHIA sires consist of 305-day lactation records standardized to a mature equivalent twice-a-day milking basis.

An asterisk at the end of a sire's registration number indicates a retabulated record. The asterisk may be followed by any number from 1 through 15 (i. e., *12) to indicate in which of the 15 printed lists his previous record appeared. Or the asterisk may be followed by the month and year (i. e., *May 51) of the DHIA letter in which his previous record appeared. Two asterisks following the sire's registration number, or following reference to a previous listing, indicate that the proved-sire tabulation or retabulation was requested by one of the States.

In case records from more than one herd were used, the reference is to the herd from which production records for the largest number of the sire's youngest daughters were reported. If the sire has been used in an artificial-breeding association, the name of the association is given.

Proved-sire records consisting of fewer than 10 comparisons are indicated as "preliminary proofs" because these records may be significantly changed when additional comparisons become available and are included in the proved-sire records.

Proved-sire records consisting of fewer than 25 comparisons with daughters resulting from artificial breeding are indicated as "preliminary AB proofs" because these records may be significantly changed when additional comparisons become available and are included in the proved-sire record.

To make the most intelligent selection of a sire, the dairyman should use these proved-sire records to single out the most promising sire and then make every effort to supplement these data with additional information gathered from the herds in which the dams and daughters made their records. Particular attention should be given to the feeding practices and environmental conditions under which the records were made, in order to be assured that the records of the daughters were not made under more favorable conditions than those of the dams or vice versa. It is especially important to determine that there has been no selection of daughters in making the comparison.
